No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 12692, Application US/09252991A

Patent No. 6551795

GRERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINGAS FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ABRUGINGAS FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR PELING DATE: 1999-02-18
PRIOR PELING DATE: 1999-07-18
PRIOR PELING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 12692
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

TITLE OF INVENTION: MacC 3. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 12097
LENGTH: 1443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 12323, Application US/09252991A

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 12333
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

sequencing reads that have not been assembled into
contigg. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Web site: http://www-seq.wi.mit.edu

```

* NOTE: This record contains 124 individual

* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows Center project name: L3764 Center clone name: 348_B_6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           * NOTE: This record contains 254 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gap of 100 bp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Smit, Ā.F.A. & Green, P. (1996-1997)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             * NOTE: This record contains 270 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                   Center code: WIBR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Phage; Genomic DNA from a single adult Zebrafish of AB strain was digested with Alu1, Cac81, HasII, NIAVI, or RsaI. Fragments in the range of 250-500 bp were gel purified and a BstX1 linker was added. The fragments were cloned into a modified MI3mpl9 vector and transformed into E. Coli DHSalpha. Microsatellite sequences were screened with labeled d(CA)15 and d(GT)15 oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PAT 17-JUL-2003

/note="Vectors: mi3MP19 with added BBtXI site; V-type:
Phage; Genomic DNA from a single adult Zebrafish of AB
strain was digested with Alul, Cac81, HaeIII, NlaVI, or
RsaI. Fragments in the range of 250-500 bp were gel
purified and a BstX1 linker was added. The fragments were
cloned into a modified Mi3mp19 vector and transformed
into B. COll DH5alpha. Microsatelllite sequences were
screened with labeled d(CA)15 and d(GT)15 oligonucleotide

/note="Vector: mi3MP19 with added BstXI site; V-type:
Phage; Genomic DNA from a single adult Zebrafish of AB
strain was digested with Alul, Cac81, HaeIII, NIAVI, or
Rsal. Fragments in the range of 250-500 bp were gel
purified and a BstXI linker was added. The fragments were
cloned into a modified Mi3mp19 vector and transformed
into E. Coli pHSalpha. Microsatelllite sequences were
screened with labeled d(CA)15 and d(GT)15 oligonucleotide

* sequencing reads that have not been assembled into
contiggs. Runs of N are used to separate the reads

* and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-firth and allows
overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
the record is updated, the accession number will
be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Web site: http://www-seq.wi.mit.edu

* NOTE: This record contains 88 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved. Contact: sequence submissions@genome.wi.mit.edu ------ Project Information Center project name: L5114 Center clone name: 589_I_12 4: contig of 724 bp in length

sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                              .

Library Construction (Standard Protocol): All procedures
discussed in this section have been described in detail
elsewhere (Soares et al., 1994; Bonaldo et al., 1996;
Jiang et al., 2001). Total cellular RNA from each sample
was isolated by using STAT-60 reagent (Tel-Test,
Friendswood, TX) and poly(A) + RNA was obtained by two
rounds of purification with the Oligotex mRNA isolation
kit (Qiagen) according to the manufacturer's instructions.
The oviduct libraries and the Day 3, 6 and 10 endometrium
libraries were constructed essentially as described by the
manufacturer's instructions provided with the SuperScript
Plasmid System (Invitrogen, caf. no. 18248-013). Briefly,
Img of poly(A) + RNA will be annealed at 37 degrees Celsius
with 10mg of NotI-tag-dT18 oligonucleotide
(GCTGCTGCGCCCC-tag-T18) and reverse transcribed at 37
degrees Celsius with SuperScript I (Invitrogen) reverse
transcriptase (Jiang et al., 2001). The 'tag' represents at
tissue/stage-specific ten-base sequence identifier
(http://genome.uiowa.edu/pubsoft/software.html) present in
the oligonucleotide used to prime first-estrand synthesis.
Second strand synthesis was performed with T4 DNA
polymerase in the presence of DNA ligase and RNase H.
After second strand synthesis was performed with T4 DNA
polymerase in the presence of DNA ligase and RNase H.
After second strand synthesis was performed with T4 DNA
polymerase in the presence of DNA ligase and RNase H.
After second strand synthesis and digested with NoI: The CDNAs will be
size selected by passage through CDNA size fractionation
columns (Invitrogen-Life technologies). The CDNAs were
mixed on an equimolant basis and ligated directionally into
the NoII and Sall sites of the pSPORTI vector
                                                                                                                                                                                       Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Cetartiodactyla; Suina; Suidae; Sus.

Endometrium and oviduct tissues from various stages of the
estrous cycle were collected from crossbred pigs (Sus
scrofa domestica), frozen in liquid nitrogen immediately
after collection, and stored at -80 degrees Celsius until
RNA extraction. The specific tissues collected were Day o
and Day 3 whole oviducts and Days 3, 6, 10 and 12-14
endometrium. More information regarding the methods can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /dev stage="Oviduct from a gilt on day 3 of the estrous cycle"

will be electroporated into DH10B bacteria. The day 12-14 endometrium library was synthesized by Dr. Bento Soares' laboratory (University of Iowa) and was cloned into the T3T7pac vector as described elsewhere (Bonaldo et al., 1996). Preliminary Library Characterization: Randomly chosen clones from each library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (~4 96-well plates) to confirm library quality [e.g. the presence of short polyA+ tails, genomic DNA contamination (wust be <1%), ribosomal RNA clones (must be <1%), etc.] and to provide a sequence database representing the predominant clones in each library. The clones were sequenced at the University of Missouri-Columbia DNA Core Facility. Bioinformatics work was performed by GK Springer's bioinformatics group (WG Spollen, UE Ries, A Guillen, AA Khambati, RV Patel, CM Topinka, SB Bhulyan) in Computer Science and Health Management and Informatics Departments at the University of Missouri-Columbia. Clone Sportments at the University of Missouri-Columbia. Clone Resility at: porcine@rnet.missouri.edu. Citations: 1. Bonaldo MF, Lennon G, Soares MB.

Normalization and Subtraction: Two approaches to facilitate gene discovery. Genome Res, 1996; 6:791-806. 2. Jiang H, Bivens NJ, Riss JG, Miltwortk MM, Green JA, Forrester LJ, Springer GK, Didion BA, Mathialagan N, Prather RS, Lucy MC (2001) Constructing cDNA libraries with fewer colnes that contain long poly(dA) tails.

Biotechniques 31:38-42. 3. Soares MB. MF Banaldo, P Jelene, L Su, L Lawton, A Efstrantiadis. 1994.

//cloud="Vector: pignor" / relating to the Monsanto Company to the University of Missouri Genetic Source: Ovarian tissue (whole ovary, dissected follicles, or corpora lutea) was collected from crossbred pigs (Sus scrofa domestica), frozen in liquid nitrogen shortly after collection, and stored at -80 degrees Celsius until RNA extraction. The tissue from several individual pigs was pooled for the purpose of RNA extraction. The specific tissues collected were fetal whole ovary; neonatal whole ovary; prepubutal whole ovary; prepubutal whole ovary; prepubutal whole ovary; small antral follicles and corpora lutea; Day 0 follicles; Day 2 corpora lutea and Day 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Library Construction (Standard Protocol): All procedures discussed in this section have been described in detail elsewhere (Scares et al., 1994; Bonaldo et al., 1996; Jiang et al., 2001). Total cellular RNA from each sample was isolated by using STAT-60 reagent (Tel-Test, Friendswood, TX) and the poly(A)+ RNA was obtained by two rounds of purification with the Oligotex mRNA isolation kit (Qiagen) according to the manufacturer's instructions. The libraries were constructed essentially as described by the manufacturer's instructions provided with the SuperScript Plasmid System (Invitrogen, cat. no. 18746-013). Briefly, Img of poly(A)+ RNA will be annealed at 37 degrees Celsius with long of Not1-tag-dr18 oligonucleotide (GTGTCTGGGGCGC-tag-T18) and reverse transcribed at 37 degrees Celsius with SuperScript II (Invitrogen) reverse transcriptase (Jiang et al., 2001). The 'tag' represente a lissue(stage-specific ten-base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Library Characterization: Randomly chosen clones from each library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (-496-well plates) to confirm library quality (e.g. the presence of short poly3+ tails, genomic DNA contamination (must be c18), ribosomal RNA clones (must be c18), ribosomal RNA clones (must be c18), ribosomal RNA clones (must be clones were sequenced at the University of Missouri-Columbia DNA Core Facility. Bioinformatics work was performed by GK Springer's bioinformatics group (WG Spollen, JB Ries), A Guillen, AA Khambati, RV Patel, CM TOpinna, SB Bhuiyah) in Computer Science and Health
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mixed on an equimolar basis and ligated directionally into
the NotI and Sall sites of the pSPORT1 vector
(Invitrogen). After ligation of the inserts, the plasmids
will be electroporated into DH10B bacteria. Preliminary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://genome.uiowa.edu/pubsoft/software.html) present ir the oligonucleotide used to prime first-strand synthesis. Second strand synthesis was performed with T4 DNA polymerase in the presence of DNA ligase and RNase H. After second strand synthesis, the double-stranded cDNAs was ligated to Sall adapters (Invitrogen-Life rechnologies) and digested with Notl. The cDNAs will be size selected by passage through cDNA size fractionation columns (Invitrogen-Life technologies). The cDNAs derived from each developmental stage of a particular tissue were from each developmental stage of a particular tissue were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Management and Informatics Departments at the University of Missouri-Columbia. Clone Requests: Requests for clones should be made to the Director of the University of Missouri DNA Core facility at: porcine@rnet.missouri.edu. Citations: 1. Bonaldo MF, Lennon G, Soares MB.

Genetic Source:
Ovariant lissue (whole ovary, dissected follicles, or
corpora lutea) was collected from crossbred pigs (Sus
scrofta domestica), frozen in liquid nitrogen shortly after
collection, and stored at -80 degrees Celsius until RNA
extraction. The tissue from several individual pigs was
pooled for the purpose of RNA extraction. The specific
tissues collected were fetal whole ovary, neonatal whole

Sequence localizations (http://genome.ulowa.edu/pubsoft/software.html) present in the oligonucleotide used to prime first-strand synthesis. Second strand synthesis was performed with T4 DNA polymerase in the presence of DNA ligase and RNAse H. After second strand synthesis, the double-stranded cDNAs was ligated to Sall adapters (Invitrogen-Life echnologies) and digested with NoLI. The CDNAs will be size selected by passage through CDNA size fractionation columns (Invitrogen-Life technologies). The CDNAs derived from each developmental stage of a particular tissue were mixed on an equimolar basis and ligated directionally into the Notl and Sall sites of the pSPORTY vector. (Invitrogen). After ligation of the inserts, the plasmids will be electroporated into DH10B bacteria. Preliminary Library were analyzed by restriction digestion to determine average insert size (96 clones) and by sequencing (~4 96-well plates) to confirm library quality (e.g. the presence of short polyA+ tails, genomic DNA contamination (must be <1%), ribosomal RNA clones (must be <1%) etc.) and to provide a sequence database representing the predominant clones in each library. The clones were sequenced at the University of Missouri-Columbia DNA Core Facility Bioinformatics work was performed by GK Springer's bioinformatics group (WG Spollen, JE Ries, A Guillen, AA Khambati, RV Patel, CM Topinka, SB Bhuiyan) in Computer Science and Health Management and Informatics Departments a clones to clones
Using et al., 2001). Total cellular RNA from each sample was isolated by using STAT-60 reagent (Tel-Test, Friendswood, TX) and the poly(A)+ RNA was obtained by two rounds of purification with the Oligotex mRNA isolation kit (Qiagen) according to the manufacturer's instructions. The libraries were constructed essentially as described by the manufacturer's instructions provided with the SuperScript Plasmid System (Invitrogen, cat. no. 1824e-013). Briefly, 1mg of poly(A)+ RNA will be annealed at 37 degrees (GETCCTGGGGCGC-Ctag-T18) and reverse transcribed at 37 degrees Celsius with SuperScript II (Invitrogen) reverse transcribed at 37 degrees Celsius with SuperScript II (Invitrogen) reverse transcribtes (GractCTGGGCCGC-tag-T18). The 'tag' represents a tissue(Stage-specific ten-base sequence identifier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of Missouri-Columbia. /note="DNA was extracted from Arabidopsis thaliana whole plant tissue, provided by members of Rob Martienssen's lab, using TRIZOL. Primers were designed in Hypothetical genes and un-annotated regions in Arabidopsis that are conserved in Brassica oleracea located in the short arm of chromosome 4. PCR products were either cloned into pCR TOPO 2.1 vector (Invitrogen) and then sequenced using -21 Ml3 forward and reverse universal primers or treated with Exonuclease 1 and Shrimp Alkaline phosphatase and sequenced using the specific primers."
